# openSEE Redesign

How It Started

Added more information about the waveform as well as data tools and analytics
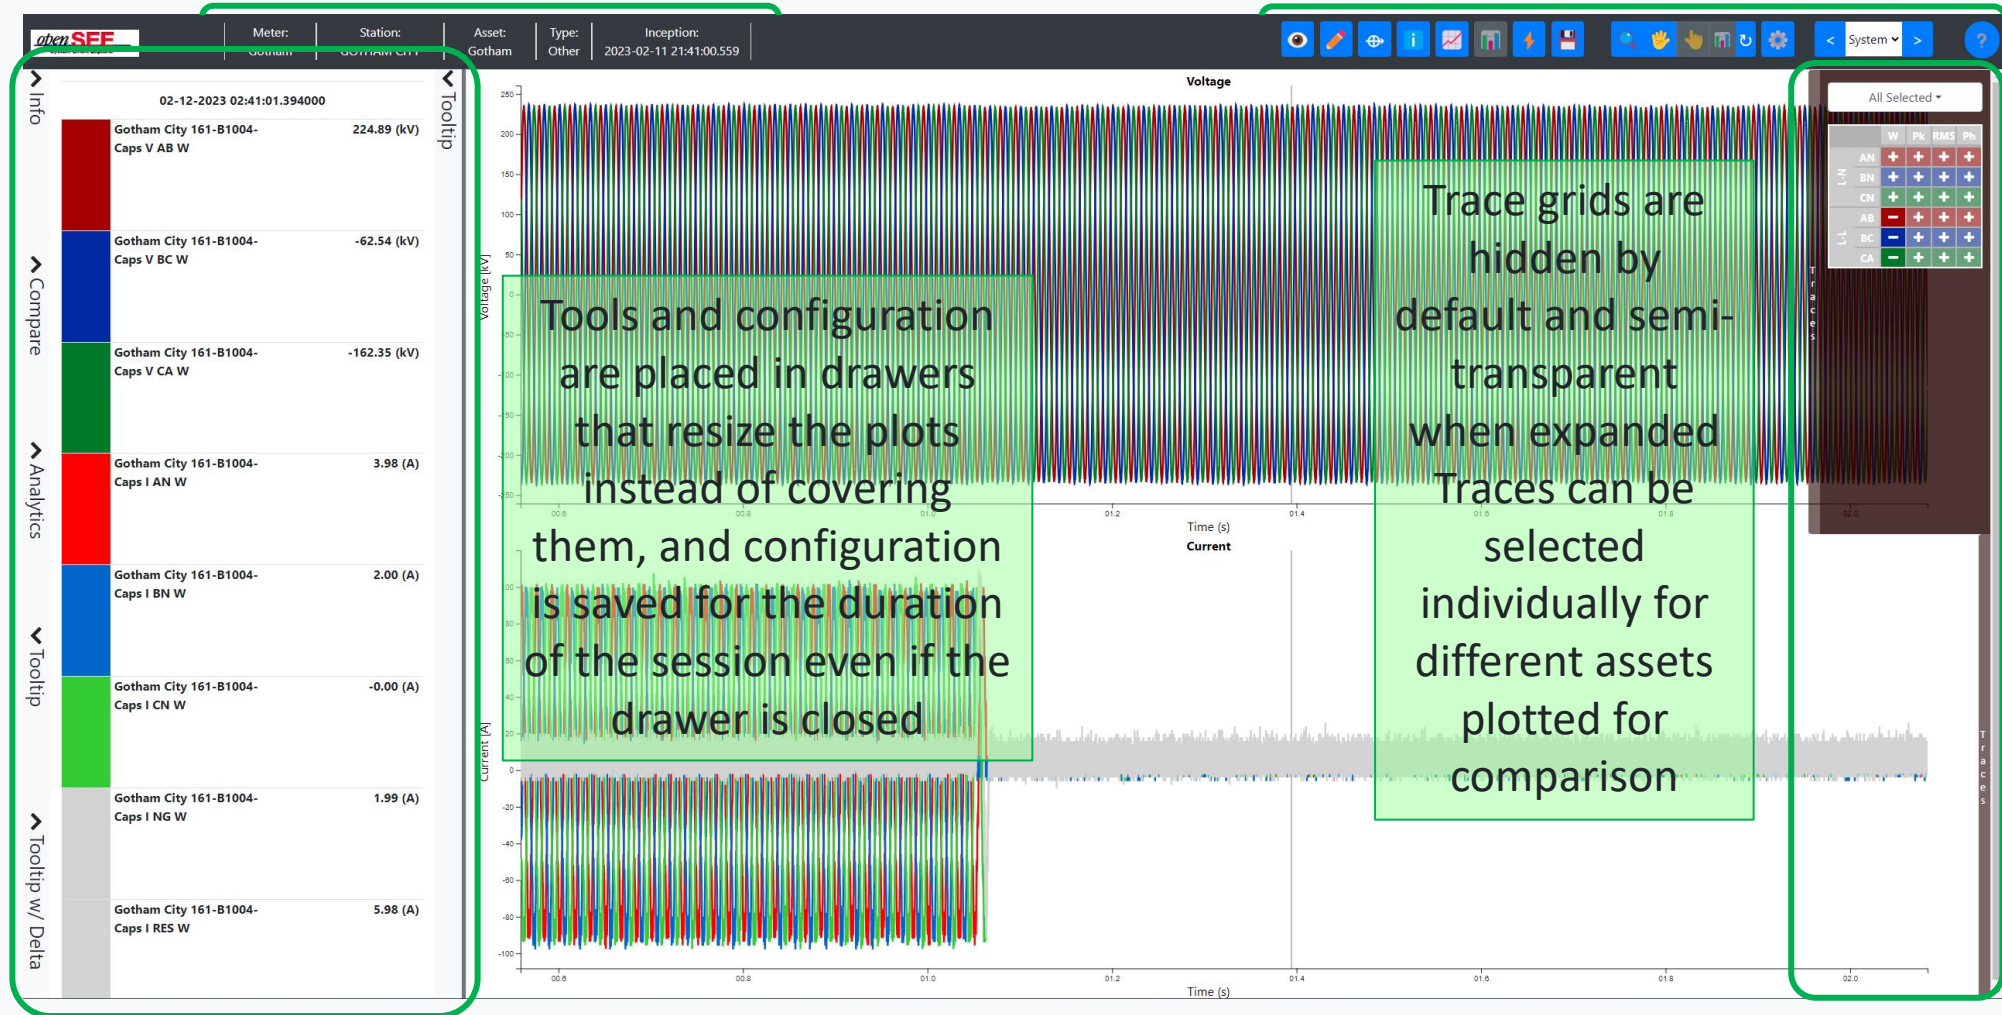

Navigation is unclear to the uninitiated

Data tools, analytics, and info reduce plot real estate, cover the plots, and replace event info, forcing users to choose or bounce between viewing options

Swapping between Info, Compare, and Analytics doesn't save selections, causing inefficient workflows

How It's Going

Tools and configuration are placed in drawers that resize the plots instead of covering them, and configuration is saved for the duration of the session even if the drawer is closed

Trace grids are hidden by default and semi-transparent when expanded Traces can be selected individually for different assets plotted for comparison

In Addition…

- General bug fixes
- URLs now have more parameters included so shared links include more configuration

What's Next?

- Continued feedback incorporation
- Improved fault distance calculations
- Utility-sponsored analytics and data tools
